

---

The official L2 Interlude Server Pack is now available for purchase on the store. These are the server files you will need to run L2 Interlude. You can now download them to your computer or install them directly onto your servers. For those of you who are installing onto your servers, I want all of you to be prepared with what it takes to create, test, and maintain a stable server environment that can handle these high-demand game servers without becoming unstable. A guide on how to maintain a stable game server environment by maintaining multiple game servers using 1 Steam account has been published within the blog post "L2 Interlude Server Pack". "That being said, this is not feasible for lots of people. So instead, here are some links that I hope will help you create a more stable environment for your L2 Interlude Server Pack servers. The first thing you will need to have is some type of controller driver. The standard Windows gaming controller driver pack won't work with Interlude so I'm providing one for the XBOX 360 controller. Download it here. There are also various other drivers available, so be sure to do some research on this. Once you have a controller driver, you'll need a Keyboard/Mouse driver. You can find one here. Standard K/M drivers may also work for Interlude but it's best if you can find a specific Interlude driver for your hardware. Now that your server is able to receive input from your keyboard and mouse or controller, it's time to test out the responsiveness of your server. There are tools that you will be able to use within the web browser to prove how fast or slow your network is working in real-time. To do this test, use the speedtest.net website and select the server closest to where you're testing (the one with highest ping). You may also want to utilize the bandwidth test site to check how much traffic your server is sending/receiving. This information is important for determining how much bandwidth you need to have available on your internet service provider or for purchasing an additional dedicated router. You can use the speedtest.net bandwidth testing tool to help you determine this information. Finally, you should also keep in mind that this Server Pack does not include any type of anti-cheat/anti-hack protection out of the box so you will have to purchase one of those separately or build your own if that's something you prefer. For those of you who prefer building your own anti-cheat/anti-hack, here are some links that will help. A guide on how to implement custom anti-cheat/anti-hack protection on your L2 Interlude Server Pack server has been published within the blog post "L2 Interlude Server Pack". The IP address of the L2 Interlude server is displayed in the Name column of the Main Menu interface. However, it will only display the IP address of the current time zone setting for your computer. To make sure that everyone on your local network knows that you are running L2, you can easily change the IP displayed in this interface by modifying one of your computer's Registry files.
